MAXM

A PROGRESSIVE NEW CONCEPT
IN RANGE-OF-MOTION THERAPY

Mechanical Advantage has designed a breakthrough approach to increase range-of-motion and accelerate rehab. Our self-therapeutic stretching equipment uses pulley systems integrated into soft, padded harnesses. Patients using the harnesses are able to rehabilitate without being totally dependent on others, as with traditional, hands-on methods.

Patients have control. Muscle guarding is reduced because the patient determines the force being applied for the duration of the stretch within his/her pain tolerance. Integral ROM stops are provided for sustained static stretch. Patients experience less fear and stress, and greater motivation as they see steady, noticeable gains. This means RESULTS.

Therapists benefit. Safe, quick, and easy to set up, MAXM works simultaneously with heat, ice, and muscle stimulation. You will spend less time fatiguing scar tissue. This time-consuming job is now delegated to the patient, with you spending quality-time finishing the stretch, if needed.

Deliver results and increase referrals. Patients using MAXM at home, between visits to therapy, achieve breakthrough results over past methods. Whatever your method or philosophy, the harness is a valuable new tool which will increase your effectiveness and offer new possibilities to you and your patients. Call for an in-service today!
